Aug 23, 2020 VMware vCloud Suite Enterprise, VMware vSphere, VMware NSX, VMware Cloud Foundation, VMware vRealize Suite. Zimbra File Share This is the version that I have. Zimbra 14.0.4 VMware vSphere Zimbra LTS3 VMware Cloud Foundry A: I assume your partner is probably providing you with some sort of "virtual appliance" which they will host on their infrastructure. From the context of the screen shot provided, this means that they have a license which allows them to host multiple virtual machines (the VMs with which they use their OS and/or tools are generally not licensed separately) on the physical server provided to you by VMware. They will typically provide the virtual appliance image which you then install on your physical server, or they will provide the image for you to install on your server. There are a few different ways that this can be done, but generally speaking you will either have them provide an OS image which you then customize or you have them create a customized image based on a base image and then provide you with the image you customized. Note that if the appliance provides software that you require to operate the appliance (in your case, the Linux distribution) then there will be two licenses, one for the appliance and one for the virtual machines that are used to run the appliance. { "name": "Dictate", "version": "0.0.0", "private": true, "description": "", "main": "lib/index.js", "scripts": { "build": "rm -rf dist && mkdir -p dist && node_modules/.bin/babel src/ --out-dir dist", "prebuild": "npm install && npm run build" }, "dependencies": { "commander": "2.11.0", "find-cache-dir": "0.1.0", "graceful-readlink": "1.0.1", "hash-sum": "1.0.3", "lru-cache": "2.2.2", "pify": "2.3.0", "2d92ce491b
