A displaced occipital condyle fracture is a rare injury pattern, and standardization of the treatment approach is difficult because of the rarity of the injury. The purpose of this study is to develop evidence-based recommendations for the management of displaced occipital condyle fractures. A review of PubMed and the Cochrane Library was conducted, using the search term "occlusal fracture OR occipital condyle fracture." We excluded case reports. All eligible studies were reviewed by 2 reviewers, and 10 studies, including 45 patients with the injury pattern, were included in the systematic review. The included studies were reviewed in accordance with the PRISMA guidelines. All patients underwent open reduction and internal fixation of the occipital condyle. Occipitocervical fusion was performed in most patients. Neurological status improved in 41 of 45 patients. Overall, postoperative instability occurred in 20 of 45 patients (45%). At the time of the most recent follow-up, 16 of 45 patients (35%) experienced postoperative instability. Of 15 patients with postoperative instability, only 1 required cervical fusion. All patients with postoperative instability had relatively less than optimal reduction of the occipital condyle on postoperative imaging. Postoperative instability and/or loss of reduction is a common complication in patients with a displaced occipital condyle fracture. This complication is associated with a relatively poor clinical outcome. Complete, stable reduction of the occipital condyle is essential to achieving a favorable clinical outcome.Q: Comparing two dicts and setting a value for a key in a new dictionary in Python I have two dictionaries, say d1 and d2. d1 = {'a': 1, 'b': 2, 'c': 3} d2 = {'a 2d92ce491b
