Basic AutoCAD Functions

In this article, we'll take a look at AutoCAD from a user perspective. If you're a business or IT professional who needs to do AutoCAD tasks on a daily basis, this guide is for you.

1. Selecting Objects

There are two main types of operations in AutoCAD: drawing and manipulating. In a drawing, you work in a 2D space, or 2D view, by placing one or more objects that define the view. In a manipulation, you work in a 3D space, or 3D view, by

placing one or more objects. In the beginning, the views of the work area display with a single highlighted object. You select objects by clicking the mouse on an object, then dragging the cursor and placing the object on the canvas. Click the AutoCAD button and then select the object to automatically place the highlighted object in the current view. You can also click a hidden object (that is, an object that isn't selected) to place it. You can use the object-selection tools and navigate to a hidden object by clicking on the canvas with the object highlighted. These tools are discussed in depth in the following article: [View Commands](#). Once a view is set up, you

select new views to create additional views. At the bottom of the window, the view mode is set to current view. You can modify the view mode by clicking in the View menu and selecting from different modes. The object selection can also be customized by right-clicking on the drawing area. You can also select a drawing object and drag it to a new location. You can draw multiple objects at once. Click the AutoCAD button at the bottom of the screen, select the objects, and click OK. Or, simply double-click the first object you selected, and the additional objects are placed on the canvas. You can
