User interface AutoCAD's user interface is designed to be intuitive and easy-to-use. The menus and toolbars are laid out in a way that is easily recognized by users. Every CAD program has features which might be frustrating to a user, however, AutoCAD has not been noted for these features. Even at the user level, a cursory survey of the CAD toolbars and menus show that AutoCAD is unique in its emphasis on functionality over design. History AutoCAD was the first commercially available CAD system (Computer-Aided Design). Like all recent CAD programs, AutoCAD has a history of success and evolving development. AutoCAD has since become one of the most popular CAD programs available. AutoCAD has been enhanced for many years by new and updated features. However, there are still many areas of AutoCAD that could be improved. AutoCAD is a complex program and new developments have changed the program's behavior in various ways. Like most programs, AutoCAD is an ever-evolving software product. AutoCAD AutoCAD was originally released in 1984 by Autodesk. AutoCAD is a software product, which was formerly referred to as AutoCAD LT or AutoCAD LT for Windows. It was originally released in 1984 as a part of AutoLISP, which was originally a drawing program. It started as a "dotted line" drawing package, then evolved into a 3D CAD program, and in 1988 it started providing 2D drafting and CAD capabilities for 2D drafting. In 1994 it added rudimentary 3D features. The first version which was natively available for both Windows and Macintosh was AutoCAD 2000. In 2005, AutoCAD 2007 was released, which included many significant new features. In 2007, AutoCAD 2009 was released, which added support for the latest AutoCAD features, some of which were added in 2007. AutoCAD 2010 was released in 2009, which includes several new features. AutoCAD 2011 was released in 2010, which includes many new features, including the ability to save multiple drawing files. AutoCAD 2012 was released in 2011, which includes several new features. AutoCAD 2013 was released in 2012, which includes several new features, including 3D printing. AutoCAD 2014 was released in 2013, which includes several new features. AutoCAD 2015 was released in 2014, which includes many new features. AutoCAD 2016 was released in a1d647c40b

Q: Mocking Python logging module, how to ignore a specific handler I'm trying to mock out the logging module to test different handlers, but I can't figure out how to ignore a specific handler. Here's the configuration I have so far: `LOGGER = logging.getLogger('app')` `class LogMock(object):` `def __init__(self, *args, **kwargs):` `self.file_handler = logging.FileHandler('/tmp/fake_log_file')` `self.logger = logging.getLogger('app')` `self.logger.handlers = []` `def log(self, message, level=logging.INFO):` `self.logger.log(level, message)` `app.py:` `from LogMock import LogMock` `def log(message):` `print message,` `level with LogMock() as log:` `print log.file_handler,` `log.logger` This works, but I'd like to disable `file_handler` from the `LogMock` class. How would I go about doing that? Is this possible? A: Why not just use the configured logging module directly? If you really need to mock it (and it seems like a design mistake), have a look at the `request_handler` in `spock`. It makes it easy to skip/change/spy on handlers. A: In Python 3.5+, you can use `typing.UnionString` if you're using Python 3.5+, or alternatively, `type(obj).__name__`. With Python 3.5+, you can also use `type(obj).__module__`, but you may need to use `py.path.local` to translate `__module__` to the name that it actually is. When using `py.path.local`, the following works: `import logging` `logging.getLogger("__builtins__").handlers[0].setLevel(logging.DEBUG)` `logging.getLogger("__builtins__").getLogger("__main__").addHandler(logging`
