The acronym stands for ThesymDo, which is the proprietary name of a certain web-based utility for password recovery, owned by a company called Symantec. In order to remember multiple different usernames and passwords, the ThesymDo browser plug-in can be used. The application works by scanning a user's memory for items containing user information. In other words, it looks for any entries that include the username and password (e.g., username+password) and collects these into a list. The information can then be used to restore access to multiple websites. The ThesymDo application is available for all major operating systems including Microsoft Windows.
