AutoCAD Raster Design 2007 lets you import a wide range of raster files, with or without text labels. Text is not commonly used for other types of raster image, so it can be useful to have AutoCAD capable of reading its text. AutoCAD is a powerful 2D CAD software used for precision drafting and documentation. AutoCAD includes all the features of AutoCAD LT, plus additional features to benefit productivity such as 3D modeling and automation of repetitive processes. AutoCAD also lets you customize the user interface with APIs and add-on apps. With AutoCAD, users are able work more efficiently with seven industry-specific toolsets to enhance automation and productivity for tasks in architecture, mechanical design, electrical design, plant design, plumbing, converting raster images, geographic information systems, and 3D mapping. Autodesk, and AutoCAD are registered trademarks of Autodesk, Inc., and/or its subsidiaries and/or affiliates in the USA and/or other countries. All other brand names, product names, or trademarks belong to their respective holders. AutoCAD Raster Design 2007 Portable

Once you have your vector output, you can save it out as a DXF, maybe we might wanna do that for future reference. Or you can save it as a DWG or you can save it as a DXF for just editing in Cadence or you can save it as a DXF for just editing in AutoCAD. Im actually going to save this out as a DXF for AutoCAD. So lets save out this one as a DXF and lets look at the properties and we can look at the DXF here, and we have a little bit of information about this file. You can see all the company specific attributes and information there and also here we can see the sheets. You can open this up in AutoCAD or later. You could open up in in Cadence, and we can edit this. We can see here our lines, polygons, arcs or you can even edit text. So if youve got the wrong text there, we can also change that. So now that weve created some vectorized raster images, lets talk about the AutoCAD conversion process and how that works. So lets go back to the step 1 here, convert the raster to vector. We can choose the text, lines, arcs, text, or any type of object here, and we can also choose to convert it to dash lines or text. The important part here is that we can use object recognition and OCR to convert the image to vector. If we did this manually, we wouldnt be able to convert each element to its correct CAD entity, since this would mean that we would need to know the CAD entity that each image element should have. But with object recognition and OCR, we can convert each object into its correct entity, this means that the AutoCAD users dont need to know anything about CAD entities and they can just write a script that will convert each image element to its respective CAD entity. To do this, were going to use the Aimeos OCR extension. If you dont know what that is, its a free and open source OCR interface for PHP, and the nice thing about this is you dont need to learn PHP, you can just use a basic text editor to write a simple script that will convert each image element to its correct CAD entity. So lets see how this works. So lets start up a new image, we need to import the raster, we can choose the image here, and a quick convert to vector, and we can convert this to DWG or DXF, and we can choose DXF. Im actually going to just select AutoCAD as my default output format. So once we have done the conversion, we need to import the DXF into AutoCAD or you could even import the DWG for Cadence if thats what youre using. And we can open up here and we can see that the layer has been opened in Cadence and the Layer properties have been opened in Cadence. Now we can select a drawing name, and we can name this layer something like raster. 5ec8ef588b
